

ABSTRACT

The present invention provides a novel sealant a novel curable resin composition providing for sufficiently high 5 mechanical strength, adhesive strength, rubber elasticity and good workability and a direct glazing method utilizing the composition.

A curable resin composition
which comprises
10 (I) a reactive silicon group-containing polyether oligomer such that the reactive silicon group exists exclusively at the molecular chain terminus and the introduction rate of the reactive silicon group into the molecular chain terminus is not less than 85% as determined by $^1\text{H-NMR}$ analysis
15 and (II) a reinforcing filler.
